                                                                                                                                       Neurogenic differentiation (NeuroD) genes (AAT74887-94) and proteins (AAW22436-43) from human, mouse and frog have been identified, isolated and sequence. NeuroD polypeptides are tissue-specific basic-helix-loop-helix (BHLH) transcriptional activators involved in neuronal, endocrine and gastrointestinal development. They were discovered by expression cloning and screening assays designed to identify possible bHLH proteins capable of interacting with the protein product of the Drosophila daugherless gene. Novel neuroD2 and neuroD3 genes, related to neuroD1, have been identified. NeuroD nucleic acids can be used to produce NeuroD polypeptides, construction of test cell lines, as probes, in gene therapy, and to

The present sequence encodes a protein which is a member of the basic helix-loop-helix (bHLH) protein family, and is designated neurob3. The bHLH genes are a family of genes associated with vertebrate neuronal, endocrinal and gastrointestinal development. The observed pattern of neuroD expression distinguishes subclasses of neuroectodermal tumours. The specification describes a method for the classification of human neuroectodermal tumours. The method comprises measuring, in a tumour sample, expression of at least one basic bHLH gene and identifying the tumour subclass by matching expression to predetermined expression profills for known subclasses. For classifying the tumour as a medulloblastoma, the bHLH gene detected is neuroD1 and neuroD3. The method is used to classify neuroectodermal tumours, and to identify

Patent No. US20020015696A1

GENERAL INFORMATION:
APPLICANT: German, Michael S.
APPLICANT: Lin, Joseph
TITLE OF INVENTION: PRODUCTION OF PANCREATIC ISLET CELLS
TITLE OF INVENTION: AND DELIVERY OF INSULIN
FILE REFERENCE: UCSF-129CIP
CURRENT APPLICATION NUMBER: US/09/817,360
CURRENT FILING DATE: 2001-03-20
PRIOR APPLICATION NUMBER: 09/535,145
PRIOR PILICATION NUMBER: 60/128,180
PRIOR APPLICATION NUMBER: 60/128,180
PRIOR FILING DATE: 1999-04-06

RESULT 1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AK008017	
LOCUS	AK008017 1540 bp mRNA linear HTC 19-JAN-2002
DEFINITION	Mus musculus adult male small intestine cDNA, RIKEN full-length
	enriched library, clone: 2010001M19: atonal homolog 5 (Drosophila),
	full insert sequence.
ACCESSION	AK008017
VERSION	AK008017.1 GI:12841941
KEYWORDS	HTC; CAP trapper.
SOURCE	Mus musculus (strain:C57BL/6J) adult male small intestine cDNA to
	mRNA, clone_lib:RIKEN full-length enriched mouse cDNA library
	clone:2010001M19.
ORGANISM	
	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
	Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.

BCORI; Site_2: ECORI; Female C57BL/6J mouse kidney and/or brain genomic DNA was isolated and partially digested with a combination of EcoRI and ECORI Methylase. Size selected DNA was cloned into the pBACe3.6 vector at the ECORI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST 01-MAY-2002

XhoI; cDNA was prepared from 2ug of poly A+ RNA.
ECORI-XhoI cut cDNA was then ligated into Unizap-XR
(Stratagene) with EcoRI at the 5' end and XhoI at the 3'
end. SS-library phagemids were prepared by mass excision
from the original library and normalized by hybridization
to blotinylated driver (prepared from the same library by
PCR) to Cot-onega of II. After removal of hybrids and
excess driver by streptuavidin sepharose chromatography,
the ss-phagemids were made double stranded and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amopodinae; Xenopus.

NOTE: This is a 'working draft' sequence. It currently consists of 80 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```
clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genme.wustl.edu/gsc

SOURCE INFORMATION:

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pleter de Jong and coworkers at http://www.chori.org pBACe3.6 VECTOR:

NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is AC004049, 2000 bp overlap; the clone sequenced to the right is RP11-148B6. Actual end of this clone is at base postition 179697 of RP11-402J6.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_feature
               Juleacu Submission.

Submitted (12-JUL-2001) Sanger Centre, Hinxton, Cambridgeshire, CBIO 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requestes: clonerques/ganger.ac.uk

On Jul 8, 2001 this sequence version replaced gi.14575291.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quallity data (i.e., phred quallity) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with thair source databases: Em: EMBL: Sw:, SWISSPROT; Tr:, TREMBL: Wp:, WORMPEP; Information on the WORMPEP http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromaphing Group. Further information can be found at change of constructed by the Sanger Centre Chromosome 10 Mapping Group. Further information can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   http://www.sanger.ac.uk/HGP/Chhilo
RP11-34333 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see
